SUMMARY

Software Engineer II at Microsoft with 3+ years building production Azure and AI systems in C#/.NET, Python, and TypeScript. Owned a greenfield AI platform's architecture; shipped agentic workflows, RAG, and multi-tenant services, saving an estimated 260+ engineering hours and doubling monthly users of a Microsoft 365 Lighthouse feature.

WORK EXPERIENCE

Microsoft Hyderabad, India
Software Engineer II Aug 2026 – Present
Software Engineer Jul 2023 – Jul 2026

AI-powered content authoring and content-health dashboard | *Microsoft's support and product docs* *2026 – Present*

- Shipped one-click accuracy reviews that generated 250+ article pull requests in 3 weeks (~170 merged): APIs rank support articles due for review by page views and open a reviewable PR in ~2–4 s via a GitHub App.
- Owned the greenfield platform's Azure architecture (Container Apps, Entra ID, Azure Data Explorer): repo strategy, a layered Backend-for-Frontend design, and cached KQL functions that cut API latency and compute load.
- Launched a self-learning AI on-call engineer on Azure SRE Agent that assisted in 99.8% of resolved incidents and saved an estimated 260+ engineering hours in 4 months; it triages with troubleshooting guides kept as Markdown in the repo (published as docs) and updates them via PRs from engineers' feedback.
- Secured APIs with OAuth 2.0: least-privilege Entra ID (Azure AD) app registrations and strict JWT validation, meeting enterprise authentication and authorization requirements.
- Engineered reliable, extensible ingestion of 23K+ GitHub issues from 115 docs repos into Azure Data Explorer (checkpointed .NET Container Apps Job, retries, OpenTelemetry alerts).
- Made the platform fully infrastructure-as-code (Bicep, Azure DevOps CI/CD), ending configuration drift; added stable Playwright E2E pipelines and production-like Azure Load Testing that drove environment upgrades.
- Fixed accuracy dashboards where only 142 of 278 views matched GitHub, using strict label-based product matching and a reversible, versioned data re-map.
- Built the proof of concept that validated the architecture, data model, and auth before build-out; prototyped an authenticated Model Context Protocol (MCP) server for AI agents.

AI article-creation pipeline | *Python services and Azure AI Foundry agents that draft and review docs* *2026 – Present*

- Built the AI reviewer agent's validation layer: 35 deterministic, unit-tested publishing checks (metadata, structure, links) that gate every draft before approval or revision.
- Automated merging of writers' edits into AI-drafted articles across an event-driven pipeline (GitHub webhooks on Azure Functions, Service Bus) with repo-allowlist and branch-prefix guardrails.
- Caught two AI agent releases that served zero traffic while pipelines were green (production stayed pinned to an old version); made every deploy pin and verify the served version.
- Set up Bicep IaC, CI/CD, and alerts-as-code for an Entra-authenticated MCP server on Azure Functions and for a new service that turns product change announcements into doc-update tasks.

Content publishing platform for Microsoft Support | *Operations, release engineering, and AI automation* *2025 – 2026*

- Created a retrieval-augmented generation (RAG) help agent over internal docs and troubleshooting guides that on-call engineers use to resolve known issues.
- Introduced versioned release branches with rollback for three services, mitigating a top-severity outage within an hour; resolved other top-severity incidents on support pages and redirects.
- Diagnosed an Azure Cognitive Search indexing failure in a high-priority escalation with no prior ramp-up, unblocking a partner team's monthly reporting.
- Ramped up on Azure Synapse and Scala in a month to own log and user-feed data pipelines; restored the beta environment and documented the system.
- Automated release and review workflows (GitHub Copilot agents, a release-branching script, AI code-review bot skills); unblocked frontend deployments and localization by fixing builds and service accounts.

Microsoft 365 Lighthouse | *Multi-tenant admin portal for IT service providers (MSPs) to secure customers* *2023 – 2025*

- Doubled monthly users of security baselines (reusable security-policy templates, e.g., require MFA, that MSPs deploy to customers) with update badges that prompt redeploys when Microsoft revises them; adopted product-wide.

- Redesigned baselines with one-click cloning of Microsoft's defaults and onboarding coach marks, lifting cloning 80%+ and core-action completion 20%+ (adjusted for user growth).
- Productized my hackathon prototype showing which customer tenants use each baseline and their rollout status, reaching a 5.9% click-through rate in month one.
- Built Microsoft 365 Copilot adoption insights for MSPs and delivered a recommended-tasks panel after code freeze to keep a high-visibility launch on time.
- Helped cut Lighthouse incidents 70%+ with a self-heal tier: noisy alerts stay notifications and page on-call only past thresholds; tuned monitors and automated incident filtering.
- Created Microsoft Graph APIs backed by Azure Data Explorer for partner sales insights (renewals, license opportunities, user preferences); lifted a 7-ID filter limit and fixed pagination.
- Raised test coverage with a team-wide AI instructions file for generating unit tests and Storybook stories, new UI unit tests, and stabilized Playwright E2E tests.
- Fixed Lighthouse-wide issues (shared empty-state components, accessibility bugs, an infinite loading shimmer) and trimmed page URLs to essential fields for security.
- Automated quarterly test-tenant onboarding (a security-compliance requirement) with AI and wrote PowerShell tools for test accounts and Graph API schema checks.
- Prototyped Copilot agents bringing Lighthouse into Microsoft Teams and used Azure OpenAI function calling to automate security-baseline deployment (hackathons).

Software Engineer Intern May 2022 – Jul 2022

- Raised the Microsoft 365 Admin Android app's update rate 60% by evaluating Xamarin and native Google Play options and building immediate and flexible in-app updates.
- Fixed edge-case bugs, validated with alpha and beta testing on 10–20 devices, and presented the proof of concept, tech doc, and recommendation to the team.

SKILLS

Languages: C#, TypeScript, JavaScript, Python, C++, Java, SQL, KQL (Kusto Query Language), Scala, PowerShell
Frameworks: .NET, ASP.NET Core, React, REST APIs, Microsoft Graph, Xamarin (Android), HTML/CSS
Azure: Container Apps, App Service, Data Explorer (ADX), Cosmos DB, Synapse, AI Search, Key Vault, Entra ID (Azure AD)
AI: Azure OpenAI, RAG, Model Context Protocol (MCP), function calling, AI Foundry, Copilot Studio, GitHub Copilot
DevOps: Bicep (IaC), Azure DevOps CI/CD, Docker, Git, OpenTelemetry, Application Insights
Testing: Playwright, unit testing, Storybook, Azure Load Testing, accessibility

AWARDS

- Winner, Harden the Core Franchise category (Data Platform Growth org), Microsoft Global Hackathon 2026: Code to Content, agentic AI that updates docs as products change, so users and AI agents get accurate answers.
- Best Hack, Live Site & Automation category (Data Platform Growth org), Microsoft Hackathon 2025: an AI agent that triages and resolves production incidents through multiple MCP servers; later piloted internally.

LEADERSHIP AND MENTORSHIP

- Mentored and onboarded new hires as the team doubled; wrote the team's Getting Started guide and a living runbook that unblocked teammates.
- Cosmos DB subject-matter expert and point of contact for the team's Microsoft Graph API design reviews; ran training sessions on Graph, Azure Data Explorer APIs, and AI tools.
- Go-to engineer for product managers' data analysis; proactively cleared pending incidents and updated troubleshooting guides beyond my ownership.

PROJECTS

- **Face Analyzer (Final Year Project)** *(React, TensorFlow, Keras, Streamlit):* Web app that analyzes faces from a camera or uploaded image with transfer-learning models and sends downloadable or emailed reports; deployed on Streamlit and GitHub Pages.
- **Face Mask Detector** *(TensorFlow, OpenCV, Streamlit):* CNN-based face mask detector trained on a public Kaggle dataset and deployed as a Streamlit web app.

EDUCATION

Birla Institute of Technology, Mesra Ranchi, India
Bachelor of Technology in Computer Science and Engineering; CGPA: 9.26/10 2019 – 2023
